1 Debugging a square root

Please explain why the following program outputs what it does.

```
i = 1
def sqrt(n):
    while i < n:
        if i*i >= n:
            return i
        i = i + 1
print('sqrt(10) is', sqrt(10))
print('i is', i)
```
