

Find an expression for angular momentum in polar coordinates.

Solution We know that an expression for velocity in polar coordinates is:

$$\vec{v} = \dot{r} \hat{r} + r \dot{\phi} \hat{\phi}$$

Then angular momentum is

$$\vec{L} = \vec{r} \times \vec{p} \tag{1}$$

$$= \vec{r} \times \mu \vec{v} \tag{2}$$

$$= r \hat{r} \times \mu (\dot{r} \hat{r} + r \dot{\phi} \hat{\phi}) \tag{3}$$

$$= r \hat{r} \times \mu (\cancel{\dot{r} \hat{r}} + r \dot{\phi} \hat{\phi}) \tag{4}$$

$$= \mu r^2 \dot{\phi} (\hat{r} \times \hat{\phi}) \tag{5}$$

$$= \begin{cases} \mu r^2 \dot{\phi} \hat{z} & \text{cylindrical coordinates} \\ -\mu r^2 \dot{\phi} \hat{\theta} & \text{spherical coordinates} \end{cases} \tag{6}$$

Recall that in the equatorial plane, the basis vector $\hat{\theta}$ points *downward*.
